### Abstract

In this paper a  $\Gamma$ -ring  $M$  is presented. We will study the concept of orthogonal generalized symmetric higher bi-derivations on  $\Gamma$ -ring. We prove that if  $M$  is a 2-torsion free semiprime  $\Gamma$ -ring,  $D_n$  and  $G_n$  are orthogonal generalized symmetric higher bi-derivations associated with symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for all  $n \in \mathbb{N}$ . Then the following relations hold for all  $x, y, z \in M, \alpha \in \Gamma$  and  $n \in \mathbb{N}$ :

- (i)  $D_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha D_n(y, z) = 0$  hence  $D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0$ .
- (ii)  $d_n$  and  $G_n$  are orthogonal and  $d_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha d_n(y, z) = 0$ .
- (iii)  $g_n$  and  $D_n$  are orthogonal and  $g_n(x, y)\alpha D_n(y, z) = D_n(x, y)\alpha g_n(y, z) = 0$ .
- (iv)  $d_n$  and  $g_n$  are orthogonal symmetric higher bi-derivations.
- (v)  $d_n G_n = G_n d_n = 0$  and  $g_n D_n = D_n g_n = 0$ .
- (vi)  $G_n D_n = D_n G_n = 0$ .

**Keywords:** Symmetric Bi-derivations  $\Gamma$ -ring, higher bi-derivations  $\Gamma$ -ring, generalized higher bi-derivations  $\Gamma$ -ring, orthogonal generalized symmetric higher bi-derivations  $\Gamma$ -ring.

### تعامل المشتقات الثنائية المتناظرة على الحلقات شبه الأولية من النمط $\Gamma$ -تعميم

### الخلاصة

في هذا البحث  $M$  هي حلقة من النمط  $\Gamma$ . سوف ندرس مفهوم تعميم تعامل المشتقات الثنائية المتناظرة على الحلقات شبه اولية من النمط  $\Gamma$ . سوف نبرهن اذا كانت  $M$  حلقة شبه اولية طليقة الالتواء من النمط  $\Gamma$ - وكانت  $D_n, G_n$  هما تعميم للمشتقات الثنائية المتناظرة المرتبطة بالمشتقات الثنائية المتناظرة  $d_n, g_n$  على التوالي لكل  $n \in \mathbb{N}$ . اذا العلاقات التالية متحققة لكل  $x, y, z \in M, \alpha \in \Gamma$ :

- (i)  $D_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha D_n(y, z) = 0$  hence  $D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0$ .
- (ii)  $d_n$  and  $G_n$  are orthogonal and  $d_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha d_n(y, z) = 0$ .
- (iii)  $g_n$  and  $D_n$  are orthogonal and  $g_n(x, y)\alpha D_n(y, z) = D_n(x, y)\alpha g_n(y, z) = 0$ .
- (iv)  $d_n$  and  $g_n$  are orthogonal symmetric higher bi-derivations.
- (v)  $d_n G_n = G_n d_n = 0$  and  $g_n D_n = D_n g_n = 0$ .
- (vi)  $G_n D_n = D_n G_n = 0$ .

### 1. Introduction

Let  $M$  and  $\Gamma$  be two additive abelian groups,  $M$  is called a  $\Gamma$  ring if the following conditions are satisfied for any  $x, y, z \in M$  and  $\alpha, \beta \in \Gamma$ :

\*Email: samahjaber33@gmail.com

- (i)  $x\alpha y \in M$   
(ii)  $x\alpha(y+z) = x\alpha y + x\alpha z$   
 $x(\alpha+\beta)y = x\alpha y + x\beta y$   
 $(x+y)\alpha z = x\alpha z + y\alpha z$   
(iii)  $(x\alpha y)\beta z = x\alpha(y\beta z)$

The notion of a  $\Gamma$ -ring was first introduced by **Nobusawa** 1964 [1] and generalized by **Barnes** 1966 [2] as above definition. It is well known that every ring is  $\Gamma$ -ring.  $M$  is called prime if  $x\Gamma M\Gamma y=0$  implies that  $x=0$  or  $y=0$  and its said to be *semiprime* if  $x\Gamma M\Gamma x=0$  implies that  $x=0$  for all  $x,y \in M$ , [3], also  $M$  is said to be  $n$ -torsion free if  $nx=0, x \in M$  implies that  $x=0$  where  $n$  is positive integer. In [4] **Jing** defined a derivation on  $\Gamma$ -ring as follows: "An additive mapping  $d:M \rightarrow M$  is said to be derivation on  $M$  if  $d(x\alpha y)=d(x)\alpha y + x\alpha d(y)$  for all  $x,y \in M$  and  $\alpha \in \Gamma$ ".

**Sapanci and Nakajima** in [5] are defined a Jordan derivation on  $\Gamma$ -ring as follows: "An additive mapping  $d:M \rightarrow M$  is said to be Jordan derivation on  $\Gamma$ -ring if  $d(x\alpha x) = d(x)\alpha x + x\alpha d(x)$  for all  $x \in M$  and  $\alpha \in \Gamma$ . It is clear that every derivation of a  $\Gamma$ -ring  $M$  is Jordan derivation of  $M$ ".

**Ceven and Ozturk** in [6] are defined a generalized derivation on  $\Gamma$ -ring as follows: "An additive mapping  $D:M \rightarrow M$  is said to be generalized derivation on  $M$  if there exists a derivation  $d:M \rightarrow M$  such that  $D(x\alpha y)=D(x)\alpha y + x\alpha d(y)$  for all  $x,y \in M$  and  $\alpha \in \Gamma$ ", also defined a Jordan generalized derivation on  $\Gamma$ -ring as follows: "An additive mapping  $D:M \rightarrow M$  is said to be Jordan generalized derivation if there exists a Jordan derivation  $d:M \rightarrow M$  such that  $D(x\alpha x) = D(x)\alpha x + x\alpha d(x)$  for all  $x \in M$  and  $\alpha \in \Gamma$ . It is clear that every generalized derivation on  $\Gamma$ -ring  $M$  is Jordan generalized derivation of  $M$ ".

**Ashraf and Jamal** in [7] are introduced the definition of orthogonal derivation on  $\Gamma$ -ring as follows: "Let  $d$  and  $g$  be two derivations on  $M$  are said to be orthogonal if  $d(x)\Gamma M\Gamma g(y) = (0) = g(y)\Gamma M\Gamma d(x)$  for all  $x,y \in M$ ", also Ashraf and Jamal are defined the orthogonal generalized derivation on  $\Gamma$ -ring as follows: "Let  $D$  and  $G$  be two generalized derivations on  $M$  is said to be orthogonal if  $D(x)\Gamma M\Gamma G(y) = (0) = G(y)\Gamma M\Gamma D(x)$  for all  $x,y \in M$ ".

In [8] **Ozturk et al.** are defined a symmetric bi-derivation on  $\Gamma$ -ring  $M$  as follows: "A mapping  $d:M \times M \rightarrow M$  is said to be symmetric if  $d(x,y)=d(y,x)$  for all  $x,y \in M$ ". "A mapping  $f:M \rightarrow M$  defined by  $f(x)=d(x,x)$ , where  $d:M \times M \rightarrow M$  is a symmetric mapping, is called the trace of  $d$  and the trace  $f$  of  $d$  satisfies the relation  $f(x+y)=f(x)+f(y)+2d(x,y)$  for all  $x,y \in M$ . A symmetric bi-additive mapping on  $M \times M$  into  $M$  is said to be symmetric bi-derivation on  $M$  if  $d(x\alpha y,z)=d(x,z)\alpha y + x\alpha d(y,z)$  for all  $x,y,z \in M, \alpha \in \Gamma$  and  $d$  is said to be Jordan bi-derivation on  $M$  if  $d(x\alpha x,y)=d(x,y)\alpha x + x\alpha d(x,y)$  for all  $x,y \in M, \alpha \in \Gamma$ ", and authors in [8] introduced the notion of generalized bi-derivation and Jordan generalized bi-derivation on  $\Gamma$ -ring as follows: "A symmetric bi-additive mapping  $D:M \times M \rightarrow M$  is said to be generalized bi-derivation if there exists  $d:M \times M \rightarrow M$  bi-derivation such that  $D(x\alpha y,z)=D(x,z)\alpha y + x\alpha d(y,z)$  for all  $x,y,z \in M, \alpha \in \Gamma$ , and  $D$  is said to be Jordan generalized bi-derivation if there exists a Jordan bi-derivation  $d:M \times M \rightarrow M$  such that  $D(x\alpha x,y)=D(x,y)\alpha x + x\alpha d(x,y)$  for all  $x,y \in M, \alpha \in \Gamma$ ".

**Marir and Salih** in [9] are introduced the concept of higher bi-derivation on  $\Gamma$ -ring  $M$  as follows: "Let  $D=(d_i)_{i \in N}$  be a family of bi-additive mapping on  $M \times M$  into  $M$  is said to be higher bi-derivation if  $d_n(x\alpha y,z\alpha w)=\sum_{i+j=n} d_i(x,z)\alpha d_j(y,w)$  for all  $x,y,z,w \in M, \alpha \in \Gamma$ ", and  $D=(d_i)_{i \in N}$  be a family of bi-additive mapping on  $M \times M$  into  $M$  is said to be Jordan bi-derivation if  $d_n(x\alpha x,y\alpha y)=\sum_{i+j=n} d_i(x,y)\alpha d_j(x,y)$  for all  $x,y \in M, \alpha \in \Gamma$ , and authors in [9] are defined the generalized higher bi-derivation on  $\Gamma$ -ring  $M$  as follows: "Let  $D=(D_i)_{i \in N}$  be a family of bi-additive mapping on  $M \times M$  into  $M$  is said to be generalized higher bi-derivation if there exists a higher bi-derivation  $d_n:M \times M \rightarrow M$  such that  $D_n(x\alpha y,z\alpha w)=\sum_{i+j=n} D_i(x,z)\alpha d_j(y,w)$  for all  $x,y,z,w \in M, \alpha \in \Gamma$ , and  $D=(D_i)_{i \in N}$  be a family of bi-additive mapping on  $M \times M$  into  $M$  is said to be Jordan generalized higher bi-derivation if there exists  $d_n:M \times M \rightarrow M$  a Jordan higher bi-derivation such that  $D_n(x\alpha x,y\alpha y) = \sum_{i+j=n} D_i(x,y)\alpha d_j(x,y)$  for all  $x,y \in M, \alpha \in \Gamma$ ".

In this paper we will extend of this results to present the concept of orthogonal generalized symmetric higher bi –derivations on *semiprime*  $\Gamma$ -ring, and we proved same of lemmas and theorems about arthogonality .

## 2. Orthogonal Generalized Symmetric Higher bi-Derivations on *Semiprime* $\Gamma$ - Rings

In this section we will the definition of orthogonal generalized symmetric higher bi-derivations on a  $\Gamma$ -ring  $M$  and we introduced an example and some Lemmas used in our work. Now, we start with the following definition

### Definition (2. 1):

Let  $D=(D_i)_{i \in \mathbb{N}}$  and  $G=(G_i)_{i \in \mathbb{N}}$  are two generalized symmetric higher bi-derivations on  $\Gamma$ -ring  $M$  ,then  $D_n$  and  $G_n$  are said to be **orthogonal** if for every  $x,y,z \in M$  , $n \in \mathbb{N}$  :

$$D_n(x,y) \Gamma M \Gamma G_n(y,z) = (0) = G_n(y,z) \Gamma M \Gamma D_n(x,y) .$$

Where

$$D_n(x,y) \Gamma M \Gamma G_n(y,z) = \sum_{i=1}^n D_i(x,y) \alpha m \beta G_i(y,z) = 0$$

For all  $m \in M$  and  $\alpha, \beta \in \Gamma$  .

The following example clarify orthogonal generalized higher bi-derivations on  $\Gamma$ -ring  $M$ .

### Example (2. 2):

Let  $d_n$  and  $g_n$  are two symmetric higher bi-derivations on  $\Gamma$ -ring  $M$ . Put  $M' = M \times M$  and  $\Gamma' = \Gamma \times \Gamma$  , we define  $d_n$  and  $g_n$  on  $M'$  into itself such that  $d_n((x,y)) = (d_n(x), 0)$  and  $g_n((x,y)) = (0, g_n(y))$  for all  $(x,y) \in M'$  and  $n \in \mathbb{N}$  . More over if  $(D_n, d_n)$  and  $(G_n, g_n)$  are generalized symmetric higher bi-derivations on  $M$  , we defined  $D_n$  and  $G_n$  on  $M'$  into itself such that  $D_n((x,y)) = (D_n(x), 0)$  and  $G_n((x,y)) = (0, G_n(y))$  for all  $(x,y) \in M'$  and  $n \in \mathbb{N}$  .Then  $(D_n, d_n)$  and  $(G_n, g_n)$  are generalized symmetric higher bi-derivations such that  $D_n$  and  $G_n$  are orthogonal .

### Lemma (2. 3): [11]

Let  $M$  be a 2-torsion free semiprime  $\Gamma$ -ring and  $a, b$  the elements of  $M$ . If for all  $\alpha, \beta \in \Gamma$  , then the following conditions are equivalent:

- (i)  $a\alpha M\beta b = 0$
- (ii)  $b\alpha M\beta a = 0$
- (iii)  $a\alpha M\beta b + b\alpha M\beta a = 0$
- (iv)  $a\alpha M\beta b + b\alpha M\beta a = 0$

If one of these conditions is fulfilled, then  $a\alpha b = b\alpha a = 0$  .

### Lemma (2. 4): [10]

Let  $M$  be a 2-torsion free semiprime  $\Gamma$ -ring and  $a, b$  the elements of  $M$  such that  $a\alpha M\beta b + b\alpha M\beta a = 0$  for all  $a, \beta \in \Gamma$  , then  $a\alpha M\beta b = b\alpha M\beta a = 0$  .

### Lemma (2. 5):

Let  $M$  be a *semiprime*  $\Gamma$ -ring .Suppose that  $D_n$  and  $G_n$  are bi-additive mappings satisfies  $D_n(x,y) \Gamma M \Gamma G_n(x,y) = (0)$  for all  $x,y \in M$  , $n \in \mathbb{N}$  . Then  $D_n(x,y) \Gamma M \Gamma G_n(y,z) = (0)$  for all  $x,y,z \in M$  and  $n \in \mathbb{N}$  .

### Proof:

Suppose that  $D_n(x,y) \Gamma M \Gamma G_n(x,y) = (0)$

$$D_n(x,y) \Gamma M \Gamma G_n(x,y) = \sum_{i=1}^n D_i(x,y) \alpha m \beta G_i(x,y) = 0 \quad (1)$$

for all  $\alpha, \beta \in \Gamma$

Replace  $x$  by  $x+z$  in (1) for all  $z \in M$  we get

$$\begin{aligned} \sum_{i=1}^n D_i(x+z, y)\alpha\mu\beta G_i(x+z, y) &= 0 \\ \sum_{i=1}^n [D_i(x, y) + D_i(z, y)]\alpha\mu\beta [G_i(x, y) + G_i(z, y)] &= 0 \\ \sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(x, y) + D_i(x, y)\alpha\mu\beta G_i(z, y) + D_i(z, y)\alpha\mu\beta G_i(x, y) + D_i(z, y)\alpha\mu\beta G_i(z, y) &= 0 \end{aligned}$$

By equation (1) we get

$$\begin{aligned} \sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(z, y) + D_i(z, y)\alpha\mu\beta G_i(x, y) &= 0 \\ \sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(z, y) &= -\sum_{i=1}^n D_i(z, y)\alpha\mu\beta G_i(x, y) \end{aligned} \quad (2)$$

Multiplication (2) by  $\gamma\tau\delta \sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(z, y)$  for all  $t \in M$  and  $\gamma, \delta \in \Gamma$  we get

$$\sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(z, y) \gamma\tau\delta \sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(z, y) = 0$$

Since  $M$  is semiprime we get

$$\sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(z, y) = 0 \quad (3)$$

Replace  $G_i(z, y)$  by  $G_i(y, z)$  in (3) we get

$$\sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(y, z) = 0$$

Hence  $D_n(x, y)\Gamma M \Gamma G_n(y, z) = (0)$

### Lemma (2. 6):

Let  $M$  be a 2-torsion free semiprime  $\Gamma$ -ring such that  $a\alpha y\beta z = a\beta y\alpha z$ , two generalized symmetric higher bi-derivations  $D_n$  and  $G_n$  associated with two symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for all  $n \in \mathbb{N}$ . Then  $D_n$  and  $G_n$  are orthogonal if and only if  $D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0$  for all  $x, y, z \in M$ ,  $n \in \mathbb{N}$  and  $\alpha, \beta \in \Gamma$ .

### Proof:

$$\begin{aligned} \text{Suppose that } D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) &= 0 \\ \sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) + G_i(x, y)\alpha D_i(y, z) &= 0 \end{aligned} \quad (1)$$

Replace  $x$  by  $x\beta w$  in (1) for all  $w \in M$  we get

$$\begin{aligned} \sum_{i=1}^n D_i(x\beta w, y)\alpha G_i(y, z) + G_i(x\beta w, y)\alpha D_i(y, z) &= 0 \\ \sum_{i=1}^n D_i(x, y)\beta d_i(w, y)\alpha G_i(y, z) + G_i(x, y)\beta g_i(w, y)\alpha D_i(y, z) &= 0 \end{aligned} \quad (2)$$

Replace  $d_i(w, y)$  by  $g_i(w, y)$  in (2) we get

$$\sum_{i=1}^n D_i(x, y)\beta g_i(w, y)\alpha G_i(y, z) + G_i(x, y)\beta g_i(w, y)\alpha D_i(y, z) = 0$$

By Lemma (2-4) we get

$$\sum_{i=1}^n D_i(x, y)\beta g_i(w, y)\alpha G_i(y, z) = \sum_{i=1}^n G_i(x, y)\beta g_i(w, y)\alpha D_i(y, z) = 0 \quad (3)$$

Replace  $g_i(w, y)$  by  $m$  in (3) for all  $m \in M$  we get

$$D_n(x, y)\Gamma M \Gamma G_n(y, z) = G_n(x, y)\Gamma M \Gamma D_n(y, z) = (0)$$

Thus  $D_n$  and  $G_n$  are orthogonal

Conversely, suppose that  $D_n$  and  $G_n$  are orthogonal

$$\begin{aligned} D_n(x, y)\Gamma M \Gamma G_n(y, z) &= (0) = G_n(x, y)\Gamma M \Gamma D_n(y, z) \\ \sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(y, z) &= 0 = \sum_{i=1}^n G_i(x, y)\alpha\mu\beta D_i(y, z) \\ \sum_{i=1}^n D_i(x, y)\alpha\mu\beta G_i(y, z) + G_i(x, y)\alpha\mu\beta D_i(y, z) &= 0 \end{aligned}$$

By Lemma (2-3) we get

$$\begin{aligned} \sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) &= \sum_{i=1}^n G_i(x, y)\alpha D_i(y, z) = 0 \\ \sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) + G_i(x, y)\alpha D_i(y, z) &= 0 \\ \text{Hence } D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) &= 0 \end{aligned}$$

### Lemma (2. 7):

Let  $M$  be a 2-torsion free semiprime  $\Gamma$ -ring such that  $a\alpha y\beta z = a\beta y\alpha z$ , two generalized symmetric higher bi-derivations  $D_n$  and  $G_n$  associated with two symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for  $n \in \mathbb{N}$ . Then  $D_n$  and  $G_n$  are orthogonal if and only if  $D_n(x, y)\alpha G_n(y, z) = 0$  or  $G_n(x, y)\alpha D_n(y, z) = 0$  for all  $x, y, z \in M$ ,  $n \in \mathbb{N}$  and  $\alpha, \beta \in \Gamma$ .

**Proof:**

$$\begin{aligned} & \text{Suppose that } D_n(x, y)\alpha G_n(y, z) = 0 \\ D_n(x, y)\alpha G_n(y, z) &= \sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) = 0 \end{aligned} \quad (1)$$

Replace  $x$  by  $x\beta w$  in (1) for all  $w \in M$  we get

$$\begin{aligned} \sum_{i=1}^n D_i(x\beta w, y)\alpha G_i(y, z) &= 0 \\ \sum_{i=1}^n D_i(x, y)\beta d_i(w, y)\alpha G_i(y, z) &= 0 \end{aligned} \quad (2)$$

Replace  $d_i(w, y)$  by  $m$  for all  $m \in M$  we get

$$\sum_{i=1}^n D_i(x, y)\beta m\alpha G_i(y, z) = 0$$

Hence we get the require result.

Similarly way if  $G_n(x, y)\alpha D_n(y, z) = 0$  we get  $D_n$  and  $G_n$  are orthogonal .

Conversely , suppose that  $D_n$  and  $G_n$  are orthogonal

$$\begin{aligned} D_n(x, y)\Gamma M \Gamma G_n(y, z) &= (0) \\ \sum_{i=1}^n D_i(x, y)\alpha m\beta G_i(y, z) &= 0 \end{aligned}$$

By Lemma (2-3) we get

$$\sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) = 0$$

Hence  $D_n(x, y)\alpha G_n(y, z) = 0$

And by  $G_n(x, y)\Gamma M \Gamma G_n(y, z) = (0)$

$$\sum_{i=1}^n G_i(x, y)\alpha m\beta D_i(y, z) = 0$$

By Lemma (2-3) we get

$$\sum_{i=1}^n G_i(x, y)\alpha D_i(y, z) = 0$$

Thus  $G_n(x, y)\alpha D_n(y, z) = 0$

**Lemma (2. 8):**

Let  $M$  be a 2-torsion free semiprime  $\Gamma$ -ring  $\alpha\gamma\beta z = \alpha\beta\gamma z$  , two generalized symmetric higher bi-derivations  $D_n$  and  $G_n$  associated with two symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for  $n \in \mathbb{N}$  .Then  $D_n$  and  $G_n$  are orthogonal iff  $D_n(x, y)\alpha g_n(y, z) = 0$  or  $d_n(x, y)\alpha G_n(y, z) = 0$  for all  $x, y, z \in M, \alpha, \beta \in \Gamma$  and  $n \in \mathbb{N}$  .

**Proof:**

$$\begin{aligned} & \text{Suppose that } D_n(x, y)\alpha g_n(y, z) = 0 \\ D_n(x, y)\alpha g_n(y, z) &= \sum_{i=1}^n D_i(x, y)\alpha g_i(y, z) = 0 \end{aligned} \quad (1)$$

Replace  $z$  by  $w\beta z$  in (1) for all  $w \in M$  we get

$$\begin{aligned} \sum_{i=1}^n D_i(x, y)\alpha g_i(y, w\beta z) &= 0 \\ \sum_{i=1}^n D_i(x, y)\alpha g_i(y, w)\beta g_i(y, z) &= 0 \end{aligned} \quad (2)$$

Replace  $g_i(y, z)$  by  $G_i(y, z)$  in (2) we get

$$\sum_{i=1}^n D_i(x, y)\alpha g_i(y, w)\beta G_i(y, z) = 0$$

By Lemma (2-3) we get

$$\sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) = 0$$

$$D_n(x, y)\alpha G_n(y, z) = 0$$

By Lemma (2-7) we get  $D_n$  and  $G_n$  are orthogonal .

Similarly we if  $d_n(x, y)\alpha G_n(y, z) = 0$  we get  $D_n$  and  $G_n$  are orthogonal .

Conversely , suppose that  $D_n$  and  $G_n$  are orthogonal.

By Lemma (2-7) we get

$$\begin{aligned} D_n(x, y)\alpha G_n(y, z) &= 0 \\ \sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) &= 0 \end{aligned} \quad (3)$$

Replace  $z$  by  $w\beta z$  in (3) for all  $w \in M$  we get

$$\begin{aligned} \sum_{i=1}^n D_i(x, y)\alpha G_i(y, w\beta z) &= 0 \\ \sum_{i=1}^n D_i(x, y)\alpha G_i(y, w)\beta g_i(y, z) &= 0 \end{aligned}$$

By Lemma (2-3) we get

$$\begin{aligned} \sum_{i=1}^n D_i(x, y)\alpha g_i(y, z) &= 0 \\ \text{Hence } D_n(x, y)\alpha g_n(y, z) &= 0 \end{aligned}$$

And replace  $x$  by  $w\beta x$  in (3) we get

$$\begin{aligned} \sum_{i=1}^n D_i(w\beta x, y)\alpha G_i(y, z) &= 0 \\ \sum_{i=1}^n D_i(w, y)\beta d_i(x, y)\alpha G_i(y, z) &= 0 \end{aligned} \quad (4)$$

Multiplication (4) by  $d_i(x, y)\alpha G_i(y, z)\delta$  for all  $\delta \in \Gamma$  we get

$$\sum_{i=1}^n d_i(x, y)\alpha G_i(y, z)\delta D_i(w, y)\beta d_i(x, y)\alpha G_i(y, z) = 0$$

Since  $M$  is *semiprime* we get

$$\begin{aligned} \sum_{i=1}^n d_i(x, y)\alpha G_i(y, z) &= 0 \\ \text{Hence } d_n(x, y)\alpha G_n(y, z) &= 0 \end{aligned}$$

### Lemma (2. 9):

Let  $M$  be a 2-torsion free *semiprime*  $\Gamma$ -ring  $\alpha\gamma\beta z = \alpha\beta\gamma z$ , two generalized symmetric higher bi-derivations  $D_n$  and  $G_n$  associated with two symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for all  $n \in \mathbb{N}$ . Then  $D_n$  and  $G_n$  are orthogonal if and only if  $D_n(x, y)\alpha G_n(y, z) = d_n(x, y)\alpha G_n(y, z) = 0$  for all  $x, y, z \in M$ ,  $\alpha \in \Gamma$  and  $n \in \mathbb{N}$ .

#### Proof:

Suppose that  $D_n$  and  $G_n$  are orthogonal

By Lemma (2-7) we get

$$D_n(x, y)\alpha G_n(y, z) = 0 \quad (1)$$

And by Lemma (2-8) we get

$$d_n(x, y)\alpha G_n(y, z) = 0 \quad (2)$$

From (1) and (2) we get  $D_n(x, y)\alpha G_n(y, z) = d_n(x, y)\alpha G_n(y, z) = 0$

Conversely, suppose that  $D_n(x, y)\alpha G_n(y, z) = 0$

By Theorem (2-7) we get

Hence  $D_n$  and  $G_n$  are orthogonal

Now, if  $d_n(x, y)\alpha G_n(y, z) = 0$

By Theorem (2-8) we get

$D_n$  and  $G_n$  are orthogonal.

### 3. Main Results

In this section, we present and study some basic Theorems of orthogonal generalized symmetric higher bi-derivations on  $\Gamma$ -ring  $M$ .

#### Theorem (3. 1):

Let  $M$  is a 2-torsion free *semiprime*  $\Gamma$ -ring  $\alpha\gamma\beta z = \alpha\beta\gamma z$ ,  $D_n$  and  $G_n$  are orthogonal generalized symmetric higher bi-derivations associated with symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for all  $n \in \mathbb{N}$ . Then the following relations are hold for all  $x, y, z \in M$ ,  $\alpha, \beta \in \Gamma$  and  $n \in \mathbb{N}$ .

$$(i) D_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha D_n(y, z) = 0 \text{ hence } D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0.$$

- (ii)  $d_n$  and  $G_n$  are orthogonal and  $d_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha d_n(y, z) = 0$  .  
 (iii)  $g_n$  and  $D_n$  are orthogonal and  $g_n(x, y)\alpha D_n(y, z) = D_n(x, y)\alpha g_n(y, z) = 0$  .  
 (iv)  $d_n$  and  $g_n$  are orthogonal symmetric higher bi-derivations .  
 (v)  $d_n G_n = G_n d_n = 0$  and  $g_n D_n = D_n g_n = 0$  .  
 (vi)  $G_n D_n = D_n G_n = 0$  .

**Proof :** (i)

Suppose that  $D_n$  and  $G_n$  are orthogonal  
 By Lemma (2-7) we get  
 $D_n(x, y)\alpha G_n(y, z) = 0$  and  $G_n(x, y)\alpha D_n(y, z) = 0$   
 $D_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha D_n(y, z) = 0$   
 Hence  $D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0$

**Proof:** (ii)

Suppose that  $D_n$  and  $G_n$  are orthogonal  
 By Lemma (2-8) we get  
 $d_n(x, y)\alpha G_n(y, z) = 0$  (1)  
 $\sum_{i=1}^n d_i(x, y)\alpha G_i(y, z) = 0$  (2)  
 Replace  $x$  by  $x\beta w$  in (2)  $w \in M, \beta \in \Gamma$  we get  
 $\sum_{i=1}^n d_i(x\beta w, y)\alpha G_i(y, z) = 0$   
 $\sum_{i=1}^n d_i(x, y)\beta d_i(w, y)\alpha G_i(y, z) = 0$  (3)  
 Replace  $d_i(w, y)$  by  $m$  in (3)  $m \in M$  we get  
 $\sum_{i=1}^n d_i(x, y)\beta m\alpha G_i(y, z) = 0$  (4)  
 And from (i)  $G_n(x, y)\alpha D_n(y, z) = 0$   
 $\sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) = 0$  (5)  
 Replace  $z$  by  $w\beta z$  in (5) we get  
 $\sum_{i=1}^n G_i(x, y)\alpha D_i(y, w\beta z) = 0$   
 $\sum_{i=1}^n G_i(x, y)\alpha D_i(y, w)\beta d_i(y, z) = 0$   
 By Lemma (2-3) we get  
 $\sum_{i=1}^n G_i(x, y)\alpha d_i(y, z) = 0$   
 $G_n(x, y)\alpha d_n(y, z) = 0$  (6)  
 And by  $\sum_{i=1}^n G_i(x, y)\alpha d_i(y, z) = 0$ , replace  $z$  by  $w\beta z$  we get  
 $\sum_{i=1}^n G_i(x, y)\alpha d_i(y, w\beta z) = 0$   
 $\sum_{i=1}^n G_i(x, y)\alpha d_i(y, w)\beta d_i(y, z) = 0$  (7)  
 Replace  $\alpha d_i(y, w)\beta$  by  $\beta d_i(w, y)\alpha$  in (7) we get  
 $\sum_{i=1}^n G_i(x, y)\beta d_i(w, y)\alpha d_i(y, z) = 0$  (8)  
 Replace  $d_i(w, y)$  by  $m$  in (8) we get  
 $\sum_{i=1}^n G_i(x, y)\beta m\alpha d_i(y, z) = 0$  (9)  
 From (4) and (9) we get  $D_n$  and  $G_n$  are orthogonal  
 From (1) and (6) we get  
 $G_n(x, y)\alpha d_n(y, z) = d_n(x, y)\alpha G_n(y, z) = 0$

**Proof:** (iii)

Similarly way used in the proof of (ii)

**Proof:** (iv)

From (i)  $D_n(x, y)\alpha G_n(y, z) = 0$   
 $\sum_{i=1}^n D_i(x, y)\alpha G_i(y, z) = 0$  (1)  
 Replacing  $x$  by  $w\beta x$  and  $z$  by  $w\gamma z$  in (1) for all  $\gamma \in \Gamma$  we get  
 $\sum_{i=1}^n D_i(w\beta x, y)\alpha G_i(y, w\gamma z) = 0$   
 $\sum_{i=1}^n D_i(w, y)\beta d_i(x, y)\alpha G_i(y, w)\gamma g_i(y, z) = 0$  (2)  
 Replace  $G_i(y, w)$  by  $m$  in (2) for all  $m \in M$  we get  
 $\sum_{i=1}^n D_i(w, y)\beta d_i(x, y)\alpha m\gamma g_i(y, z) = 0$  (3)  
 Multiplication (3) by  $d_i(x, y)\alpha m\gamma g_i(y, z)\delta$  for all  $\delta \in \Gamma$  we get

$$\sum_{i=1}^n d_i(x, y) \alpha \gamma g_i(y, z) \delta D_i(w, y) \beta d_i(x, y) \alpha \gamma g_i(y, z) = 0$$

Since M is *semiprime* we get

$$\sum_{i=1}^n d_i(x, y) \alpha \gamma g_i(y, z) = 0$$

$$d_n(x, y) \Gamma M \Gamma g_n(y, z) = (0)$$

Hence  $d_n$  and  $g_n$  are orthogonal symmetric higher bi-derivations.

**Proof:** (v)

Since by (ii)  $d_n(x, y) \alpha G_n(y, z) = 0$

$$G_n(d_n(x, y) \alpha G_n(y, z), m) = 0 \text{ for all } m \in M$$

$$\sum_{i=1}^n G_i(d_i(x, y) \alpha G_i(y, z), m) = 0 \quad (1)$$

Replace  $x$  by  $x\beta w$  in (1) for all  $w \in M, \beta \in \Gamma$  we get

$$\sum_{i=1}^n G_i(d_i(x\beta w, y) \alpha G_i(y, z), m) = 0$$

$$\sum_{i=1}^n G_i(d_i(x, y) \beta d_i(w, y) \alpha G_i(y, z), m) = 0$$

$$\sum_{i=1}^n G_i(d_i(x, y), m) \beta g_i(d_i(w, y), m) \alpha g_i(G_i(y, z), m) = 0 \quad (2)$$

Replace  $g_i(G_i(y, z), m)$  by  $G_i(d_i(x, y), m)$  in (2) we get

$$\sum_{i=1}^n G_i(d_i(x, y), m) \beta g_i(d_i(w, y), m) \alpha G_i(d_i(x, y), m) = 0$$

Since M is *semiprime* we get

$$\sum_{i=1}^n G_i(d_i(x, y), m) = 0$$

$$\text{Thus } G_n d_n = 0 \quad (3)$$

And by (ii)  $G_n(x, y) \alpha d_n(y, z) = 0$

$$d_n(G_n(x, y) \alpha d_n(y, z), m) = 0$$

$$\sum_{i=1}^n d_i(G_i(x, y) \alpha d_i(y, z), m) = 0 \quad (4)$$

Replace  $x$  by  $x\delta w$  in (4) for all  $\delta \in \Gamma$  we get

$$\sum_{i=1}^n d_i(G_i(x\delta w, y) \alpha d_i(y, z), m) = 0$$

$$\sum_{i=1}^n d_i(G_i(x, y) \delta g_i(w, y) \alpha d_i(y, z), m) = 0$$

$$\sum_{i=1}^n d_i(G_i(x, y), m) \delta d_i(g_i(w, y), m) \alpha d_i(d_i(y, z), m) = 0 \quad (5)$$

Replace  $d_i(d_i(y, z), m)$  by  $d_i(G_i(x, y), m)$  in (5) we get

$$\sum_{i=1}^n d_i(G_i(x, y), m) \delta d_i(g_i(w, y), m) \alpha d_i(G_i(x, y), m) = 0$$

Since M is *semiprime* we get

$$\sum_{i=1}^n d_i(G_i(x, y), m) = 0$$

$$\text{Thus } d_n G_n = 0 \quad (6)$$

From (3) and (6) we get

$$G_n d_n = d_n G_n = 0$$

Similarly way to prove that  $D_n g_n = g_n D_n = 0$ .

**Proof:** (vi)

Since  $D_n$  and  $G_n$  are orthogonal

$$D_n(x, y) \Gamma M \Gamma G_n(y, z) = (0)$$

$$G_n(D_n(x, y) \Gamma M \Gamma G_n(y, z), r) = (0) \text{ for all } r \in M$$

$$\sum_{i=1}^n G_i(D_i(x, y) \alpha m \beta G_i(y, z), r) = 0$$

$$\sum_{i=1}^n G_i(D_i(x, y), r) \alpha g_i(m, r) \beta g_i(G_i(y, z), r) = 0 \quad (1)$$

Replace  $g_i(G_i(y, z), r)$  by  $G_i(D_i(x, y), r)$  we get

$$\sum_{i=1}^n G_i(D_i(x, y), r) \alpha g_i(m, r) \beta G_i(D_i(x, y), r) = 0$$

Since M is *semiprime* we get

$$\sum_{i=1}^n G_i(D_i(x, y), r) = 0$$

$$\text{Thus } G_n D_n = 0 \dots (2)$$

And by  $G_n(x, y) \Gamma M \Gamma D_n(y, z) = (0)$

$$D_n(G_n(x, y) \Gamma M \Gamma D_n(y, z), r) = (0)$$

$$\sum_{i=1}^n D_i(G_i(x, y) \alpha m \beta D_i(y, z), r) = 0$$

$$\sum_{i=1}^n D_i(G_i(x, y), r) \alpha d_i(m, r) \beta d_i(D_i(y, z), r) = 0 \quad (3)$$

Replace  $d_i(D_i(y, z), r)$  by  $D_i(G_i(x, y), r)$  in (3) we get

$$\sum_{i=1}^n D_i(G_i(x, y), r) \alpha d_i(m, r) \beta D_i(G_i(x, y), r) = 0$$

Since M is *semiprime* we get

$$\sum_{i=1}^n D_i(G_i(x, y), r) = 0$$

Thus  $D_n G_n = 0$  (4)

From (2) and (4) we get

$$G_n D_n = D_n G_n = 0$$

**Theorem (3.2):**

Let  $M$  be 2-torsion freeseprime  $\Gamma$ -ring  $\alpha\gamma\beta z = \alpha\beta\gamma\alpha z$ ,  $D_n$  and  $G_n$  are generalized symmetric higher bi-derivations associated with symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for all  $n \in \mathbb{N}$ . Then the following relations are equivalent for all  $x, y \in M$  and  $\alpha, \beta \in \Gamma$ :

- (i)  $D_n$  and  $G_n$  are orthogonal
- (ii)  $D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0$
- (iii)  $d_n(x, y)\alpha G_n(y, z) + g_n(x, y)\alpha D_n(y, z) = 0$

**Proof:** (i)  $\Leftrightarrow$  (ii)

Suppose that  $D_n$  and  $G_n$  are orthogonal

By Theorem (3-1) (i) we get

$$D_n(x, y)\alpha G_n(y, z) = G_n(x, y)\alpha D_n(y, z) = 0$$

Hence  $D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0$

$$\text{Conversely, Let } D_n(x, y)\alpha G_n(y, z) + G_n(x, y)\alpha D_n(y, z) = 0$$

By Lemma (2-6) we get

Hence  $D_n$  and  $G_n$  are orthogonal

$$(i) \Leftrightarrow (iii)$$

Suppose that  $D_n$  and  $G_n$  are orthogonal

By Lemma (2-8) we get

$$d_n(x, y)\alpha G_n(y, z) = 0 \tag{1}$$

And by Theorem (3-1) (i) we get

$$G_n(x, y)\alpha D_n(y, z) = 0$$

$$\sum_{i=1}^n G_i(x, y)\alpha D_i(y, z) = 0 \tag{2}$$

Replace  $x$  by  $t\beta x$  in (2) for  $t \in M$  we get

$$\sum_{i=1}^n G_i(t\beta x, y)\alpha D_i(y, z) = 0$$

$$\sum_{i=1}^n G_i(t, y)\beta g_i(x, y)\alpha D_i(y, z) = 0 \tag{3}$$

Multiplication (3) by  $g_i(x, y)\alpha D_i(y, z)\delta$  for all  $\delta \in \Gamma$  we get

$$\sum_{i=1}^n g_i(x, y)\alpha D_i(y, z)\delta G_i(t, y)\beta g_i(x, y)\alpha D_i(y, z) = 0$$

Since  $M$  semiprime we get

$$\sum_{i=1}^n g_i(x, y)\alpha D_i(y, z) = 0$$

$$g_n(x, y)\alpha D_n(y, z) = 0 \tag{4}$$

From (1) and (4) we get

$$d_n(x, y)\alpha G_n(y, z) + g_n(x, y)\alpha D_n(y, z) = 0$$

$$\text{Conversely, Let } d_n(x, y)\alpha G_n(y, z) + g_n(x, y)\alpha D_n(y, z) = 0$$

$$\sum_{i=1}^n d_i(x, y)\alpha G_i(y, z) + g_i(x, y)\alpha D_i(y, z) = 0 \tag{5}$$

Replace  $x$  by  $x\gamma t$  in (5) for all  $\gamma \in \Gamma$  we get

$$\sum_{i=1}^n d_i(x\gamma t, y)\alpha G_i(y, z) + g_i(x\gamma t, y)\alpha D_i(y, z) = 0$$

$$\sum_{i=1}^n d_i(x, y)\gamma d_i(t, y)\alpha G_i(y, z) + g_i(x, y)\gamma g_i(t, y)\alpha D_i(y, z) = 0 \tag{6}$$

Replacing  $d_i(x, y)$  by  $D_i(x, y)$  and  $g_i(x, y)$  by  $G_i(x, y)$  in (6) we get

$$\sum_{i=1}^n D_i(x, y)\gamma d_i(t, y)\alpha G_i(y, z) + G_i(x, y)\gamma g_i(t, y)\alpha D_i(y, z) = 0 \tag{7}$$

Replaced  $d_i(t, y)$  by  $g_i(t, y)$  in (7) we get

$$\sum_{i=1}^n D_i(x, y)\gamma g_i(t, y)\alpha G_i(y, z) + G_i(x, y)\gamma g_i(t, y)\alpha D_i(y, z) = 0$$

By Lemma (2-4) we get

$$\sum_{i=1}^n D_i(x, y)\gamma g_i(t, y)\alpha G_i(y, z) = \sum_{i=1}^n G_i(x, y)\gamma g_i(t, y)\alpha D_i(y, z) = 0$$

Hence  $D_n$  and  $G_n$  are orthogonal

**Theorem (3. 3):**

Let  $M$  be 2-torsion free *semiprime*  $\Gamma$ -ring  $axy\beta z = a\beta y\alpha z$ ,  $D_n$  and  $G_n$  are generalized symmetric higher bi-derivations associated with symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for all  $n \in \mathbb{N}$ . Then  $D_n$  and  $G_n$  are orthogonal iff  $D_n(x, y)\alpha G_n(y, z) = 0$  for all  $x, y, z \in M$ ,  $\alpha, \beta \in \Gamma$  and  $d_n G_n = d_n g_n = 0$ .

**Proof:**

Suppose that  $D_n$  and  $G_n$  are orthogonal

By Theorem (2-7) we get

$$D_n(x, y)\alpha G_n(y, z) = 0 \quad (1)$$

And by Theorem (3-1) (i) we get

$$\begin{aligned} G_n(x, y)\alpha d_n(y, z) &= 0 \\ d_n(G_n(x, y)\alpha d_n(y, z), m) &= 0 \\ \sum_{i=1}^n d_i(G_n(x, y)\alpha d_i(y, z), m) &= 0 \end{aligned} \quad (2)$$

Replace  $x$  by  $x\beta t$  in (2) for all  $t \in M$  we get

$$\begin{aligned} \sum_{i=1}^n d_i(G_i(x\beta t, y)\alpha d_i(y, z), m) &= 0 \\ \sum_{i=1}^n d_i(G_i(x, y)\beta g_i(t, y)\alpha d_i(y, z), m) &= 0 \\ \sum_{i=1}^n d_i(G_i(x, y), m)\beta d_i(g_i(t, y), m)\alpha d_i(d_i(y, z), m) &= 0 \end{aligned} \quad (3)$$

Replace  $d_i(d_i(y, z), m)$  by  $d_i(G_i(x, y), m)$  in (3) we get

$$\begin{aligned} \sum_{i=1}^n d_i(G_i(x, y), m)\beta d_i(g_i(t, y), m)\alpha d_i(G_i(x, y), m) &= 0 \\ \text{Since } M \text{ is } \textit{semiprime} \text{ we get} \\ \sum_{i=1}^n d_i(G_i(x, y), m) &= 0 \\ d_n G_n &= 0 \end{aligned} \quad (4)$$

Also by Theorem (3-1) (iv) we get

$$\begin{aligned} g_n(x, y)\Gamma M \Gamma d_n(y, z) &= (0) \\ d_n(g_n(x, y)\Gamma M \Gamma d_n(y, z), r) &= (0) \text{ for all } r \in M \\ \sum_{i=1}^n d_i(g_i(x, y)\alpha m \beta d_i(y, z), r) &= 0 \\ \sum_{i=1}^n d_i(g_i(x, y), r)\alpha d_i(m, r)\beta d_i(d_i(y, z), r) &= 0 \end{aligned} \quad (5)$$

Replace  $d_i(y, z)$  by  $g_i(x, y)$  in (5) we get

$$\begin{aligned} \sum_{i=1}^n d_i(g_i(x, y), r)\alpha d_i(m, r)\beta d_i(g_i(x, y), r) &= 0 \\ \text{Since } M \text{ is } \textit{semiprime} \text{ we get} \\ \sum_{i=1}^n d_i(g_i(x, y), r) &= 0 \\ d_n g_n &= 0 \end{aligned} \quad (6)$$

From (1) and (4), (6) we get

$$\begin{aligned} D_n(x, y)\alpha G_n(y, z) &= 0 \text{ and } d_n G_n = d_n g_n = 0 \\ \text{Conversely, suppose that } D_n(x, y)\alpha G_n(y, z) &= 0 \end{aligned} \quad (7)$$

And  $d_n G_n = 0$

$$\begin{aligned} (d_n G_n)(x\alpha y, z) &= 0 \\ \sum_{i=1}^n d_i(G_i(x\alpha y, z), m) &= 0 \text{ for all } m \in M \\ \sum_{i=1}^n d_i(G_i(x, z)\alpha g_i(y, z), m) &= 0 \\ \sum_{i=1}^n d_i(G_i(x, z), m)\alpha d_i(g_i(y, z), m) &= 0 \end{aligned} \quad (8)$$

Replacing  $(G_i(x, z), m)$  by  $(x, y)$  and  $d_i(g_i(y, z), m)$  by  $G_i(y, z)$  in (8) we get

$$\begin{aligned} \sum_{i=1}^n d_i(x, y)\alpha G_i(y, z) &= 0 \\ d_n(x, y)\alpha G_n(y, z) &= 0 \end{aligned} \quad (9)$$

From (7) and (9) we get

$$D_n(x, y)\alpha G_n(y, z) = d_n(x, y)\alpha G_n(y, z) = 0$$

By Lemma (2-9) we get  $D_n$  and  $G_n$  are orthogonal

**Theorem (3. 4):**

Let  $M$  be a 2-torsion free *semiprime*  $\Gamma$ -ring such that  $axy\beta z = a\beta y\alpha z$  and  $D_n$  be a generalized symmetric higher bi-derivations associated with symmetric higher bi-derivations  $d_n$  for all  $n \in \mathbb{N}$ . If  $D_n(x, y)\alpha D_n(y, z) = 0$  for all  $x, y, z \in M$ ,  $\alpha, \beta \in \Gamma, n \in \mathbb{N}$  then  $D_n = d_n = 0$ .

**Proof:**

$$\text{Suppose that } D_n(x, y)\alpha D_n(y, z) = 0$$

$$\sum_{i=1}^n D_i(x, y)\alpha D_i(y, z) = 0 \quad (1)$$

Replace  $z$  by  $t\beta z$  in (1) for all  $t \in M, \beta \in \Gamma$  we get

$$\sum_{i=1}^n D_i(x, y)\alpha D_i(y, t\beta z) = 0$$

$$\sum_{i=1}^n D_i(x, y)\alpha D_i(y, t)\beta d_i(y, z) = 0$$

By Lemma (2-3) we get

$$\sum_{i=1}^n D_i(x, y)\alpha d_i(y, z) = 0 \quad (2)$$

Multiplication (2) by  $d_i(y, z)\delta$  for all  $\delta \in \Gamma$  we get

$$\sum_{i=1}^n d_i(y, z)\delta D_i(x, y)\alpha d_i(y, z) = 0$$

Since  $M$  is *semiprime* we get

$$\sum_{i=1}^n d_i(y, z) = 0$$

$$d_n = 0 \quad (3)$$

And multiplication (1) by  $\delta D_i(x, y)$  we get

$$\sum_{i=1}^n D_i(x, y)\alpha D_i(y, z)\delta D_i(x, y) = 0$$

Since  $M$  is *semiprime* we get

$$\sum_{i=1}^n D_i(x, y) = 0$$

$$D_n = 0 \quad (4)$$

From (3) and (4) we get

$$D_n = d_n = 0$$

**Theorem (3.5):**

Let  $M$  be a 2-torsion free *semiprime*  $\Gamma$ -ring. Let  $U$  be an ideal of  $M$  and  $V = \text{Ann.}(U)$ . If  $(D_n, d_n)$  is generalized symmetric higher bi-derivations for all  $n \in \mathbb{N}$  such that  $D_n(M), d_n(M) \subset U$  then  $D_n(V) = d_n(V) = 0$ .

**Proof:**

If  $x, y \in V, \alpha \in \Gamma$  then  $(x y) \alpha U = 0$

By hypothesis we have

$$d_n(M) \subset U \implies d_n(U) \subset U$$

Hence  $0 = D_n(x\alpha z, y)$

$$0 = \sum_{i=1}^n D_i(x\alpha z, y)$$

$$0 = \sum_{i=1}^n D_i(x, y)\alpha d_i(z, y) \quad (1)$$

Multiplication (1) by  $\beta D_i(x, y)$  for all  $\beta \in \Gamma$  we get

$$0 = \sum_{i=1}^n D_i(x, y)\alpha d_i(z, y)\beta D_i(x, y)$$

Since  $M$  is *semiprime* we get

$$0 = \sum_{i=1}^n D_i(x, y) \in U \cap V$$

$$D_n(x, y) = 0$$

Similarly, since  $(x y) \alpha U = 0$  for all  $x, y \in V, \alpha \in \Gamma$

$$0 = d_n(x\alpha z, y)$$

$$0 = \sum_{i=1}^n d_i(x\alpha z, y)$$

$$0 = \sum_{i=1}^n d_i(x, y)\alpha d_i(z, y) \quad (2)$$

Multiplication (2) by  $\beta d_i(x, y)$  we get

$$0 = \sum_{i=1}^n d_i(x, y)\alpha d_i(y, z)\beta d_i(x, y)$$

Since  $M$  is *semiprime* we get

$$0 = \sum_{i=1}^n d_i(x, y) \in U \cap V$$

$$d_n(x, y) = 0$$

**Theorem (3.6):**

Let  $M$  be 2-torsion free *semiprime*  $\Gamma$ -ring  $x\alpha y\beta z = x\beta y\alpha z$  for all  $x, y, z \in M$  and  $\alpha, \beta \in \Gamma$ ,  $D_n$  and  $G_n$  are generalized symmetric higher bi-derivations associated with symmetric higher bi-derivations  $d_n$  and  $g_n$  respectively for all  $n \in \mathbb{N}$ . Then  $D_n$  and  $g_n$  as well as  $G_n$  and  $d_n$  are orthogonal iff  $D_n = d_n = 0$  or  $G_n = g_n = 0$ .

**Proof:**

Suppose that  $D_n$  and  $g_n$  as well as  $G_n$  and  $d_n$  are orthogonal

By Theorem (3-1) (iii) we get

$$\begin{aligned} D_n(x, y)\alpha g_n(y, z) &= 0 \\ \sum_{i=1}^n D_i(x, y)\alpha g_i(y, z) &= 0 \end{aligned} \quad (1)$$

Multiplication (1) by  $\beta D_i(x, y)$  for all  $\beta \in \Gamma$  we get

$$\begin{aligned} \sum_{i=1}^n D_i(x, y)\alpha g_i(y, z)\beta D_i(x, y) &= 0 \\ \text{Since M is semiprime we get} \\ \sum_{i=1}^n D_i(x, y) &= 0 \\ D_n &= 0 \end{aligned} \quad (2)$$

And by Theorem (3-1) (ii) we get

$$\begin{aligned} d_n(x, y)\alpha G_n(y, z) &= 0 \\ \sum_{i=1}^n d_i(x, y)\alpha G_i(y, z) &= 0 \end{aligned} \quad (3)$$

Multiplication (3) by  $\beta d_i(x, y)$  we get

$$\begin{aligned} \sum_{i=1}^n d_i(x, y)\alpha G_i(y, z)\beta d_i(x, y) &= 0 \\ \text{Since M is semiprime we get} \\ \sum_{i=1}^n d_i(x, y) &= 0 \\ d_n &= 0 \end{aligned} \quad (4)$$

Now, by Theorem (3-1) (iii) we get

$$\begin{aligned} g_n(x, y)\alpha D_n(y, z) &= 0 \\ \sum_{i=1}^n g_i(x, y)\alpha D_i(y, z) &= 0 \end{aligned} \quad (5)$$

Multiplication (5) by  $\beta g_i(x, y)$  we get

$$\begin{aligned} \sum_{i=1}^n g_i(x, y)\alpha D_i(y, z)\beta g_i(x, y) &= 0 \\ \text{Since M is semiprime we get} \\ \sum_{i=1}^n g_i(x, y) &= 0 \\ g_n &= 0 \end{aligned} \quad (6)$$

And by Theorem (3-1) (ii) we get

$$\begin{aligned} G_n(x, y)\alpha d_n(y, z) &= 0 \\ \sum_{i=1}^n G_i(x, y)\alpha d_i(y, z) &= 0 \end{aligned} \quad (7)$$

Multiplication (7) by  $\beta G_i(x, y)$  we get

$$\begin{aligned} \sum_{i=1}^n G_i(x, y)\alpha d_i(y, z)\beta G_i(x, y) &= 0 \\ \text{Since M is semiprime we get} \\ \sum_{i=1}^n G_i(x, y) &= 0 \\ G_n &= 0 \end{aligned} \quad (8)$$

From (2) , (4) and (6) ,(8) we get

$$\begin{aligned} D_n = d_n = 0 \text{ or } G_n = g_n = 0 \\ \text{Conversly , suppose that } D_n = d_n = 0 \text{ or } G_n = g_n = 0 \end{aligned}$$

$$\begin{aligned} D_n(xaz, y) &= 0 \\ g_n(D_n(xaz, y), m) &= 0 \\ \sum_{i=1}^n g_i(D_i(xaz, y), m) &= 0 \\ \sum_{i=1}^n g_i(D_i(x, y)\alpha d_i(z, y), m) &= 0 \\ \sum_{i=1}^n g_i(D_i(x, y), m)\alpha g_i(d_i(z, y), m) &= 0 \end{aligned} \quad (9)$$

Replacing  $g_i(D_i(x, y), m)$  by  $(x, y)$  and  $(d_i(z, y), m)$  by  $(y, z)$  in (9) we get

$$\begin{aligned} \sum_{i=1}^n D_i(x, y)\alpha g_i(y, z) &= 0 \\ D_n(x, y)\alpha g_n(y, z) &= 0 \end{aligned}$$

By Theorem (3-1) (iii)

Hnce  $D_n$  and  $g_n$  are orthogonal

Similarly , if  $G_n = g_n = 0$  we get

Hence  $G_n$  and  $d_n$  are orthogonal

**Theorem (3.7):**

Let M be a 2-torsion free semiprime  $\Gamma$ -ring,  $D_n$  and  $G_n$  are generalized symmetric higher bi-derivations for all  $n \in \mathbb{N}$ . Suppose that  $D_n \Gamma G_n = G_n \Gamma D_n$  , then  $D_n - G_n$  and  $D_n + G_n$  are orthogonal .

**Proof:**

Suppose that  $D_n \Gamma G_n = G_n \Gamma D_n$ , then for  $x, y \in M$  :

$$\begin{aligned}
&= [(D_n + G_n)\Gamma(D_n - G_n) + (D_n - G_n)\Gamma(D_n + G_n)](x, y) \\
&= [(D_n + G_n)\Gamma(D_n - G_n)](x, y) + [(D_n - G_n)\Gamma(D_n + G_n)](x, y) \\
&= \sum_{i=1}^n [(D_i + G_i)\alpha(D_i - G_i)](x, y) + \sum_{i=1}^n [(D_i - G_i)\alpha(D_i + G_i)](x, y) \text{ for all } \alpha \in \Gamma \\
&= \sum_{i=1}^n (D_i \alpha D_i - D_i \alpha G_i + G_i \alpha D_i - G_i \alpha G_i)(x, y) + \sum_{i=1}^n (D_i \alpha D_i + D_i \alpha G_i - G_i \alpha D_i - G_i \alpha G_i)(x, y) = \\
&\sum_{i=1}^n D_i(x, y) \alpha D_i(x, y) - D_i(x, y) \alpha G_i(x, y) + G_i(x, y) \alpha D_i(x, y) - G_i(x, y) \alpha G_i(x, y) + \\
&\sum_{i=1}^n D_i(x, y) \alpha D_i(x, y) + D_i(x, y) \alpha G_i(x, y) - G_i(x, y) \alpha D_i(x, y) - G_i(x, y) \alpha G_i(x, y) \\
&\text{Therefore } \sum_{i=1}^n [(D_i + G_i)\alpha(D_i - G_i)](x, y) + \sum_{i=1}^n [(D_i - G_i)\alpha(D_i + G_i)] = 0 \\
&\text{By Lemma (2-4) we get} \\
&\sum_{i=1}^n [(D_i + G_i)\alpha(D_i - G_i)](x, y) = 0 = \sum_{i=1}^n [(D_i - G_i)\alpha(D_i + G_i)](x, y) \\
&\text{Thus } D_n - G_n \text{ and } D_n + G_n \text{ are orthogonal}
\end{aligned}$$
